Chapter 4: Loops

Python Programming Notes | Beginner Study Chapter

The for loop

A for loop repeats a block for each item in an iterable, such as a list, string or range. Use it to process collection items or repeat an action a known number of times. For example, for name in names visits each name in a list.

Using range

range(5) produces the integers 0, 1, 2, 3 and 4. range(1, 6) produces 1 through 5. The stop value is excluded. range(2, 10, 2) produces 2, 4, 6 and 8. The third argument is the step.

The while loop

A while loop repeats while its condition is True. Update the value used in the condition so that the loop can stop. A loop whose condition never becomes False can run forever.

break and continue

break exits the nearest loop immediately. continue skips the rest of the current iteration and moves to the next one. A loop inside another loop is called a nested loop.

Try this code

```
for number in range(1, 6):
    print(number)

count = 1
while count <= 3:
    print(count)
    count += 1
```
